

# AI Portfolio Builder — Process Documentation

A repeatable, four-step workflow for turning a raw resume into a deployed, recruiter-ready portfolio website using AI tools. Each step feeds its output into the next, so treat the prompts as a pipeline rather than one-off requests.

## Overview

| Step | Goal                                    | Input                                                           | Output                                    |
|------|-----------------------------------------|-----------------------------------------------------------------|-------------------------------------------|
| 1    | Extract & structure resume content      | Resume (PDF/DOCX/text)                                          | Clean Markdown portfolio content          |
| 2    | Capture a hero-section design direction | Reference site screenshot/URL                                   | A reusable style spec (not copied design) |
| 3    | Merge everything into one build prompt  | Outputs of Step 1 + 2, GitHub, LinkedIn, theme, animation prefs | Single "master prompt"                    |
| 4    | Generate, customize, deploy             | Master prompt                                                   | Live portfolio URL                        |

**Tools used:** an AI chat model (Claude/ChatGPT) for Steps 1–3, an AI website builder (Bolt.new, Claude Artifacts, v0.dev) for Step 4, StackBlitz for edits, Vercel/Netlify for hosting.

**Before you start, have ready:**

- Resume file (PDF or DOCX)
- GitHub profile URL + 2–3 pinned repo links
- LinkedIn profile URL
- A rough color/theme preference (e.g., "dark, monochrome, one accent color")
- A rough animation preference (e.g., "subtle scroll reveals, no heavy 3D")

## Step 1 — Extract & Structure Your Information

**Why the original prompt falls short:** it asks for sections but doesn't tell the model *how* to prioritize content, how concise "concise" means, or what to do when a resume is missing a section (e.g., no certifications). Without that, output quality varies a lot between runs.

**Improved Prompt**

```
You are a portfolio content strategist. I will give you my resume as input.

TASK
Analyze the resume completely and restructure it into portfolio-ready content.
Do not simply copy resume phrasing — rewrite every section in a confident,
professional, human tone suitable for a personal website (not a resume).

OUTPUT SECTIONS (in this order)
```

1. Hero Introduction – a 1-sentence role/positioning line + a 2-sentence supporting statement. Provide 2 alternative versions of the hero line so I can choose a tone (bold vs. understated).
2. About Me – 80–120 words, first-person, story-driven (not a bullet list of facts). Mention what I build/work on and what I'm currently focused on.
3. Skills – grouped into categories (e.g., Languages, Frameworks, Tools, Domains) rather than one flat list. Order each group by proficiency/relevance.
4. Projects – for each project include: name, 1-line value proposition, 3 bullet highlights (impact/metrics if available, tech stack used), and a placeholder for a live link and repo link.
5. Experience – reverse-chronological. For each role: title, org, dates, and 2–4 achievement-focused bullets (start with action verbs, quantify impact wherever the resume gives numbers; do not invent numbers).
6. Education – degree, institution, dates, relevant coursework or honors only if notable.
7. Certifications – name, issuer, date. Omit this section entirely (don't output an empty header) if none exist in the resume.
8. Achievements – awards, competition results, publications, notable recognitions. Omit if none exist.
9. Contact Information – email, phone (optional), location (city/state only).
10. Social Links – GitHub, LinkedIn, portfolio, and any other professional links present in the resume.

#### RULES

- Keep total output scannable: no paragraph longer than 3 sentences.
- Preserve every factual detail (dates, tools, numbers) exactly as given – never fabricate metrics, employers, or dates.
- Flag any section where the resume has insufficient information instead of inventing content, using: "⚠ Needs input: [what's missing]".
- Return everything in clean Markdown with H2 headers per section.

Here is my resume:

## Step 2 — Find Hero-Section Design Inspiration

**Why the original prompt falls short:** "analyze this design" run once on a single link produces a shallow, generic description. A stronger version forces the model to separate *system-level* patterns (layout, spacing, motion) from anything that's identifiably a copy of the source, and outputs a spec structured enough to actually paste into a builder.

#### Reference sites to browse first:

- <https://motionsites.ai/>
- <https://dribbble.com/tags/landbook>
- <https://www.awwwards.com/rubensanchez/collections/creative-portfolios/>
- <https://land-book.com/>

Pick 2–3 hero sections you like (not just one) — this gives the model enough signal to extract a *pattern*, not a copy.

#### Improved Prompt

You are a UI/UX design analyst. I will describe or link 2–3 hero sections I like the style of.

#### TASK

Analyze the shared design references and extract the underlying design SYSTEM — not the specific content, copy, imagery, or branding. I do not want a clone; I want a reusable style specification.

#### ANALYZE THESE DIMENSIONS

- Layout: grid structure, alignment, whitespace ratio, content hierarchy
- Typography: heading scale, font pairing style (serif/sans, weight contrast), line-height feel
- Color approach: palette logic (monochrome / duotone / accent-on-neutral), contrast level, dark vs. light bias
- Motion: what animates on load vs. on scroll, easing feel (snappy vs. fluid), whether motion is subtle or dominant
- CTA treatment: button style, placement, primary vs. secondary hierarchy
- Spacing rhythm: how sections breathe, density level
- Overall mood: 3 adjectives that summarize the vibe (e.g., "minimal, confident, technical")

#### OUTPUT FORMAT

Return a structured style spec, not prose, using this shape:

```
### Hero Design Spec
```

- Layout:
- Typography:
- Color System:
- Motion Behavior:
- CTA Style:
- Spacing:
- Mood (3 adjectives):

Then convert that spec into a single paragraph written as an instruction an AI website builder could follow to GENERATE A NEW, ORIGINAL hero section in this style — describing the pattern only, with no references to the source sites' names, brands, or exact copy.

---

## Step 3 — Generate the Master Prompt

**Why the original prompt falls short:** "combine the following" with no tech-stack, SEO, or structural constraints leaves the AI builder to guess — which is where most AI-generated portfolios end up looking generic. The improved version pins down stack, structure, and non-negotiables so the builder has one clear target.

### Improved Prompt

You are a senior frontend architect. Combine the inputs below into ONE complete, unambiguous build prompt for an AI website builder (Bolt.new / Claude Artifacts / v0). The builder will only get this prompt — so it must be fully self-contained.

#### INPUTS TO MERGE

1. Portfolio content: [PASTE STEP 1 OUTPUT]
2. Hero design spec: [PASTE STEP 2 OUTPUT]
3. GitHub: [URL]
4. LinkedIn: [URL]
5. Resume-derived focus area / target role: [e.g., "Cybersecurity + Full-Stack Development"]
6. Color theme: [e.g., "black & white monochrome, one accent color"]
7. Animation preference: [e.g., "GSAP scroll reveals, smooth-scroll via Lenis, no heavy 3D unless specified"]

#### REQUIREMENTS THE FINAL PROMPT MUST SPECIFY

- Tech stack: Next.js + Tailwind CSS + GSAP (or Framer Motion) as default, unless the animation preference above says otherwise.
- Section order: Hero → About → Skills → Projects → Experience → Education → Certifications/Achievements → Contact → Footer (with social links).
- Responsiveness: mobile-first, explicit breakpoints (mobile / tablet / desktop), no horizontal scroll or overflow on small screens.
- SEO: page title, meta description, Open Graph tags, semantic HTML (proper heading hierarchy, alt text placeholders for images).
- Performance: lazy-loaded images, no render-blocking animation on first paint, Lighthouse-friendly.
- Accessibility: sufficient color contrast, keyboard-navigable nav and buttons, aria-labels on icon-only links.
- Placeholder handling: use clearly marked placeholders for any missing images/links rather than broken elements.
- A dedicated, working Contact section (form or mailto — specify which).
- Include the GitHub and LinkedIn URLs as functional links, not placeholder text.

#### OUTPUT

Return ONLY the final master prompt, written as a single instruction block ready to paste into an AI website builder — no explanation, no preamble, no commentary before or after it.

---

## Step 4 — Build, Customize, Deploy

1. **Generate** Paste the Step 3 master prompt into Bolt.new, Claude Artifacts, or v0.dev. Generate the full site in one pass first — resist editing the prompt after every small issue; note fixes and batch them.
2. **Review before editing** Check: does every section from Step 1 appear? Does the hero match the Step 2 mood? Is it responsive at 375px, 768px, and 1440px widths?
3. **Refine in StackBlitz** Import the generated project and adjust:
  - Colors — confirm contrast still passes on both light/dark elements
  - Fonts — check loading (no flash of unstyled text)
  - Images — replace placeholders with real project screenshots/photos
  - Text — proofread against your actual resume for accuracy
  - Animations — trim anything that feels slow on scroll (aim for GSAP durations under ~0.6s for UI reveals)
  - Responsiveness — recheck after every visual change
4. **Pre-deploy checklist**
  - ☐ All links (GitHub, LinkedIn, project repos/live demos) work
  - ☐ Contact method actually reaches you (test the form/mailto)
  - ☐ Meta title + description are set (not the builder's default)

- ☐ Favicon added
  - ☐ No console errors in browser dev tools
  - ☐ Lighthouse score checked (Performance, Accessibility, SEO)
5. **Deploy** Push to Vercel or Netlify, connect a custom domain if you have one, and confirm HTTPS is active.
  6. **Share** Once live, add the link to your LinkedIn, GitHub profile README, resume header, and outreach messages to recruiters/clients.
- 

## Common Pitfalls

- **Skipping Step 2 and jumping to Step 3** — the master prompt ends up with a generic hero because there's no style spec to anchor it.
- **Pasting the raw resume text into Step 3** — always run it through Step 1 first; raw resume phrasing reads badly on a website.
- **One-shotting endless small edits through the AI builder** — batch visual tweaks and do them directly in StackBlitz once the structure is right; it's faster and gives more control.
- **Forgetting to remove placeholder content** — AI builders often leave "Lorem ipsum" or placeholder project names if inputs were incomplete; always do a full read-through before deploying.
